

Practical Application

- **Identify at least three processes you interact with regularly.**
 - What are some types of poka-yoke that exist in each process?
 - What are the kinds of mistakes or errors that they are trying to prevent?
 - How effective are they at preventing those errors?
 - What other errors in each process could've been prevented if poka-yoke were applied?
 - What measurable impact could be realized if that poka-yoke were implemented?
